

Does Local Government Want to Make Road Safety a Priority? (What Can Help Unlock the Potential in Your Road Infrastructure?)

David McTiernan, National Leader Transport Safety

International Public Works Conference, 2019

Introduction and Overview

- Is road safety a local government priority?
- Road safety approach - Then vs. Now
- Case studies
- What needs to happen?
- Top 5 take aways

Is Road Safety a Local Government Priority?

Key observations...

- Councils are the road authority for local roads
- Crashes occur on local roads every day
- Local government road safety...
 - Under-resourced
 - Under-funded
 - Lack necessary skills and expertise
 - Lack a whole of organisation approach and integration
 - Applies an outdated approach to road safety
- State and Federal Government road safety models
 - Funding relevance
 - Lacking engagement
 - Leadership in policy setting

Best Practice or Standard Practice?

Fundamentally for planners, designers and traffic managers, the task will be to **adopt a systemic approach** to build a safe road system focusing on core injury mechanisms.

Safety needs to be the **default position** from which variations are justified as opposed to many current practices that lead to the need to justify changes to ‘add on’ safety.

Then vs Now

	Conventional	Safe System
What is the problem?	Accidents	Fatalities and Serious Injuries
What causes the problem?	Mainly poor road user performance Speeding, drink driving, inattention, deliberate risk taking	System failures
Who is ultimately responsible?	Individual road users	System designers and operators
What is the major planning approach?	Incremental approach to reduce the problem with an associated residual crash problem	A systemic approach to build a safe road system and minimise the harm
What is the appropriate goal?	Optimum number of fatalities and serious injuries based on competing objectives	Towards the virtual elimination of death and serious injuries
What is the trade-off?	A balance between mobility and safety	Maximising safe mobility
How is the effort coordinated?	Incremental gain within individual pillars (roads / speeds / vehicles / people)	Optimise solutions across pillars (roads / speeds / vehicles / people) – pillars compensate for each other where performance is poor
What are the cultural manifestations?	Legal liability avoidance and risk aversion	Risk assessment, innovation, trials and demonstrations
Context of tools in use	Bias towards pre-existing crash history, understanding crash causes and likelihood, optimising the network for motor vehicles	Risk analysis based on network design attributes supplemented by crash data, understanding crash consequence, optimising the network for all road users and human frailty

A photograph of a two-lane asphalt road winding through a dense forest of tall, thin trees. The road has white dashed center lines and solid white edge lines. The sky is overcast and grey. In the upper right corner, there is a semi-transparent white circular graphic containing the title text.

CASE STUDY 1

Managing risk

Typical vs. Conditioned vs. 'Standard' vs. Innovation

Design feature	Existing (typical) (A)	Condition of consent	Austroads		Haul route
			Standard x-section	WCLT	
CLT width, (m)	0.1 – 0.3				
Lane width (m) (x2)	3.1 - 3.4				
Seal shld. (m) (x2)	0.5 – 1.5				
Shld. width (m) (x2)	< 0.8				
Unseal shld. (x2)	< 0.5				
Total seal width (m)	~ 8.4				
Total form. width (m)	< 9.4				

+ minimum 3.0 m clear zone

Case Study 1 – Then versus Now Review

The approach by the Developer...

	Conventional	Safe System
What is the problem?	Accidents	Fatalities and Serious Injuries ✓
What causes the problem?	Mainly poor road user performance Speeding, drink driving, inattention, deliberate risk taking	System failures ✓
Who is ultimately responsible?	Individual road users	System designers and operators ✓
What is the major planning approach?	Incremental approach to reduce the problem with an associated residual crash problem	A systemic approach to build a safe road system and minimise the harm ✓
What is the appropriate goal?	Optimum number of fatalities and serious injuries based on competing objectives	Towards the virtual elimination of death and serious injuries ✓
What is the trade-off?	A balance between mobility and safety	Maximising safe mobility ✓
How is the effort coordinated?	Incremental gain within individual pillars (roads / speeds / vehicles / people)	Optimise solutions across pillars (roads / speeds / vehicles / people) – pillars compensate for each other where performance is poor ✓
What are the cultural manifestations?	Legal liability avoidance and risk aversion	Risk assessment, innovation, trials and demonstrations ✓
Context of tools in use	Bias towards pre-existing crash history, understanding crash causes and likelihood, optimising the network for motor vehicles	Risk analysis based on network design attributes supplemented by crash data, understanding crash consequence, optimising the network for all road users and human frailty ✓

CASE STUDY 2

Crash response

Case Study 2 – The Road

Case Study 2 – The Crash

What was Known?...

*In the case of this section of XXXX Road, despite anecdotal evidence of repeated non-casualty crashes, there were **few official crash statistics at this location prior to the two fatal crashes.***

Source: Council file note

Case Study 2 – Was There a Problem?

5-year crash history (2011 – 2015)

- 22 crashes
- 15 single vehicle
- 4 head-on
- 19 FSI crashes
- Casualty crash rate $>1.5/\text{km}/\text{year}$

Source: State Government's online crash database

The Council Approach

*Council has not pursued guardrail at this location in isolation as it does not address these **root causes of the crashes** at this location. If Council does not address the factors leading to loss of control on the corner, which it considers to be **mainly speed related**, Council will potentially be faced with a maintenance issue from vehicles impacting with the guardrail, and new hazards the guardrail may create. While guardrail may prevent vehicles from leaving the roadway, it would potentially hold vehicles in the path of oncoming vehicles, as occurred in the 2015 fatal crash.*

The Council Approach

Council has not pursued guardrail at this location in isolation as it does not address these root causes of the crashes at this location. If Council does not address the factors leading to loss of control on the corner, which it considers to be mainly speed related, Council will potentially be faced with a maintenance issue from vehicles impacting with the guardrail, and new hazards the guardrail may create. While guardrail may prevent vehicles from leaving the roadway, it would potentially hold vehicles in the path of oncoming vehicles, as occurred in the 2015 fatal crash.

Source: Council file note

The Council Approach

*Council officers are already well advanced in seeking Blackspot funding for road improvement projects on XXXX Road, and that **this remained the preferred course of action.***

Unlocking the
potential (safety)
in your road
infrastructure

What Needs to Happen...?

...And why hasn't it yet?

- Local government approach toward road safety needs to shift
 - Road safety as a **default position**
 - Accept responsibility
 - Whole of council commitment
 - Adopt a systemic approach
 - Measure and report road safety performance
 - Be innovative in solutions
- Professional development
 - Training
 - Technical guidelines
 - Adopt and apply available tools

What Needs to Happen...?

...And why hasn't it yet?

- State and Federal government
 - Legislative change
 - Improved and targeted funding models
 - Engagement with councils and local government issues
- Road safety – what's it about?
 - People...the road users, community, friends and family

Top Five Take-aways

Unlocking the potential (safety) in your road infrastructure

- Stay current
- Know your network
- Engage
- Innovate
- Attitude
