ater

- **1.** The case for collecting cost data
- 2. An approach to estimating urban water costs

rne

- **3. Some sample results**
- 4. Ideas on how to collect more data

D

Costing data and statistics. Why the need?

Melbourne

atei

Why do we estimate costs?

- Conceptual planning
- Options assessment
- Budget forecasting

What happens if we get it wrong?

- Redesign on-the-fly
- Funding shortfalls
- Sub-optimal outcomes
- Impacts on other projects

ER

Infrastructure Costing - The Problems

We know we get it wrong!

258 transport infrastructure projects

- 9 out of 10 underestimate cost.
- Cost underestimation has not decreased over the past 70 years.
- On average, costs are underestimated by 28%. (Flyvbjerg et al. 2002)

The "list of horror stories is endless"

- Scottish Parliament, where final costs were £431 million yet the original estimate was £40 million
- Remodelling of kitchens by American homeowners, who on average expected the job to cost \$18,658, but it actually cost \$38,769. (Kahneman 2011)

Melbourne Desalination Plant

Infrastructure Costing – The problems

Why do we get it wrong?

- Rumsfeldian uncertainty?
- Technical errors (e.g. inadequate data)
- Optimism
- Self-interest & political reasons
- The most common reasons are political and selfinterest:

"deception and lying in power struggles aimed at getting projects started and at making a profit appear to best explain why costs are highly and systematically underestimated" Flyvbjerg et al. (2002)

Solutions

• Adopt an *"outside view"*, see Kahneman (2011)

lelhourne

Infrastructure Costing – the problems

Conceptually easy

Practically difficult (time consuming)

- Data not publically available
- Data in different formats (pre-construction, post-construction, tied up with other costs)
- Information spatially and temporally variable
- Maybe we just find it all a bit boring?

Is it a good use of time and resources?

- Small projects?
- Large projects?
- The market will deliver lowest cost (but this doesn't help us at the planning stage)
- Centralised collection of data would be beneficial

Approach: Pipes

Melbourne Water

ΑΙ

moroka

ER

vicroads

Approach

Wetlands & Bioretention

- Conceptual design using MUSIC
- Design curves from local guidelines
- Costs from local water authorities

Wastewater, Potable Water

- Connection costs for new dwellings
- Annual water charges
- Essential Services Commission
- Assumption: 70% of revenue for recovery of capital costs; 30% to operating costs

Stormwater Harvesting

- Conceptual design
- Water balance modelling
- Rawlinsons Construction Manual
- Previous similar studies / projects

Melbourne

Approach

Plumbing

- Abel & Brown 2012
- Rawlinsons Construction Manual

Retarding Basins

- Conceptual design
- RORB

Chapter 4 - The Plan

The Plan

Introduction The flood warning process consists of a series of interdependent components, broadly categorised as monitoring, interpretation, communication, response and review.

e flood warning process consists of a series of terdependent components, broadly categorised

s monitoring, interpretation, communication, sponse and review. BMT WBM recognise that

ch component is critical to the effective oper

Building on our extensive floodplain managemen expertise, BMT WBM is able to design and deliver best practice flood warning solutions which meet the needs of the end user. BMT WBM is able to design and deliver best practice flood warning solutions which meet the needs of the end user.

How does this help?

Building on our extensive floadplain management expertise, BMT WBM is able to design and deliver best practice fload warning solutions which meet the needs of the end user. The fload warning process consists of a series of interdependent components, broadly categorised

interdependent components, broadly categorise as monitoring, interpretation, communication, response and review. BMT WBM recognise that each component is critical to the effective operation of the system.

Results: Capital Costs

Element	Capital Cost Rate
Stormwater pipes	\$1000 per residential dwelling
Sewer reticulation	\$2400 per residential lot
Potable water reticulation	\$4400 per residential lot
Third pipe reticulation	\$2600 per residential lot
Wetlands	\$6500 to \$8500 per hectare of development area
Wastewater – bulk removal & treatment	\$6700 to \$8500 per residential lot

ER

Summary

Estimating costs is important

- Resource allocation
- Decision making
- Optimal planning outcomes

We estimate costs poorly

- Data are scarce
- We need an "outside view"

We need to collect more data

- Let's work together
- Any volunteers to take the lead?

Urban water servicing in Melbourne's Growth Areas

- \$90,000 per lot in PV terms
- Stormwater infrastructure comprises 8% of total costs
- 15-20% of stormwater infrastructure costs are WSUD
